TYPE 674: AIR SUPPLY PLENUM WITH UP TO 100 PORTS AND RH INPUT

General Description

Type674 models a supply air plenum. In version 1.x of these libraries, Type674 took inlet air relative humidity as an input while another component (Type646) took humidity ratio. With the release of the second version of this library, Type646 was modified to include a mode parameter, allowing the model to take either humidity ratio or relative humidity as an input. Type674 has been included in version 2.x only for backward compatibility and will not be included in future versions. It is recommended that you change all instances of Type674 to Type646. For the technical description of both Type674 and Type646, please refer to the Type646 documentation.
